The set of all complex numbers. Just as all real numbers can be imagined as sitting on a line, all complex numbers can be thought of as points in a plane. The plane of complex numbers spanned by the vectors 1 and i , where i is the imaginary number. Every complex number corresponds to a unique point in the complex plane.

SOLUTION: What is a complex plane? - algebra.com

Take the square root of each side, and. Simplify the radical, using the equivalence for i , and the complex solutions are. The real root is 2, and the imaginary roots are $5i$ and $-5i$. Find all the roots, real and imaginary, of the equation $5x^2 - 8x + 5 = 0$.
 $x = 0.4 + 0.6i, 0.4 - 0.6i$.

Solving Equations with Complex Solutions - dummies

Here on the horizontal axis, that's going to be the real part of our complex number. And our vertical axis is going to be the imaginary part. So in this example, this complex number, our real part is the negative 2 and then our imaginary part is a positive 2. And so that right over there in the complex plane is the point negative 2 plus $2i$.

So, the general solution to a system with complex roots is $\left[\begin{matrix} x \\ y \end{matrix} \right] (t) = \{c_1\} \begin{matrix} u \\ v \end{matrix} \left(t \right) + \{c_2\} \begin{matrix} u \\ v \end{matrix} \left(t \right)$ where $\begin{pmatrix} u \\ v \end{pmatrix} \left(t \right)$ and $\begin{pmatrix} u \\ v \end{pmatrix} \left(t \right)$ are found by writing the first solution as

Complex Analysis: Problems with solutions

A complex number is usually denoted by the letter 'z'. 'a' is called the real part, and 'b' is called the imaginary part of the complex number. The notion of complex numbers increased the solutions to a lot of problems. For instance, had complex numbers been not there, the equation $x^2 + x + 1 = 0$ had had no solutions.
